

Subjective Assessment of COVID-19 Risks in Japan: The Role of Media Sources

October 6, 2023

Asako Chiba (Tokyo Foundation for Policy Research)

Taisuke Nakata (University of Tokyo)

Thuy Linh Nguyen (University of Tokyo)

Reo Takaku (Hitotsubashi University)

Research purposes

- Understand how Japanese people perceive the risks of infection and fatality of COVID-19
- Explore the role of information sources in shaping their risk perceptions

What we do

- We conduct a large-scale survey in February 2023 to investigate the subjective assessments of COVID-19 risks in Japan.
- We compare perceived risks with actual ones and evaluate the extent of overestimation or underestimation.
- We apply multivariate logistic regressions to examine how information sources are linked to the perception (overestimation or underestimation) of COVID-19 risks.
 - Content and tone variations in COVID-19 reporting can lead to systematic variation in people's overall assessment of COVID-19.

Key results

- Notable differences in risk perception across media preferences
- Infection risk:
 - Readers of the Asahi newspaper are more likely to overestimate the risk of infection and less likely to underestimate it compared to others.
- Fatality risk:
 - Viewers of NHK-TV and TBS-TV, as well as readers of the Asahi newspaper are more inclined to overestimate fatality risk and less inclined to underestimate fatality risk than others.
 - Viewers of Fuji-TV and Asahi-TV and readers of the Yomiuri newspaper tend to overestimate fatality risk more than others.

Literature

- COVID-19 risk perceptions
 - Japan: Adachi et al. (2022), Sato et al. (2023)
 - Other countries: Cipolletta et al. (2022), Dryhurst et al. (2020), Dyer et al. (2022), Savadori & Lauriola (2022), Wise et al. (2020), etc.
- Few studies compare the perceived and actual risks
 - Abel et al. (2021), Akesson et al. (2022), Graso (2022)
- Media sources, usage behavior and COVID-19 risk perception
 - Adachi et al. (2022), Gollust et al. (2020), Huynh et al. (2020), Vai et al. (2020)
- Limited knowledge on risk perceptions in the post-pandemic stage, and/or the role of information sources

Design of the survey

- Country: Japan
- Period: February 22 to February 27, 2023.
- Target: Men and women aged 20 and older nationwide
- Number of valid responses: 40,000
- Nationally representative: Distributions in age, gender, and place of residence was matched to those in the 2020 Population Census
- Ethics approval number (University of Tokyo): 22-388

Survey questions - Perception of COVID-19 risks

- We inquired about:
 - Subjective probability of contracting COVID-19 within the next month
 - Subjective probability of fatality if infected within the next month
 - Response options: (1) less than 0.001%, (2) 0.001% – 0.01%, (3) 0.01% – 0.1%, (4) 0.1% – 1%, (5) 1% – 5%, (6) 5% – 10%, (7) 10% – 20%, (8) 20% – 50%, and (9) 50% or higher

Survey questions (cont.) – Individual characteristics

- Basic information: age, gender, place of residence, education level, income class
- Attributions:
 - Male: 48.0%, Female: 52.0%;
 - Age groups: 20s-30s: 24.4%, 40s-50s: 33.5%, Over 60s: 42.1%
- Household structure (living arrangement with spouse/partner, elderly members, children)
- Health situation: smoking habits, medical history of chronic diseases
- COVID-19-related experiences: vaccination status, number of past infections, acquaintances' COVID-19-related deaths
- Primary media source (e.g., television, newspaper, internet, SNS, or others)

Calculation of actual risks

- Data sources:
 - Population of Japan – Statistics Bureau of Japan
 - Newly confirmed and death cases – Ministry of Health, Labour and Welfare
- Actual risks:
 - Infection risk: 0.20% (Period: February 24 – March 23, 2023)
 - Fatality risk: 0.24% (Period: November 1, 2022 – February 28, 2023 (eighth wave of COVID-19))

Risk perception toward COVID-19 in February 2023

Infection Risk

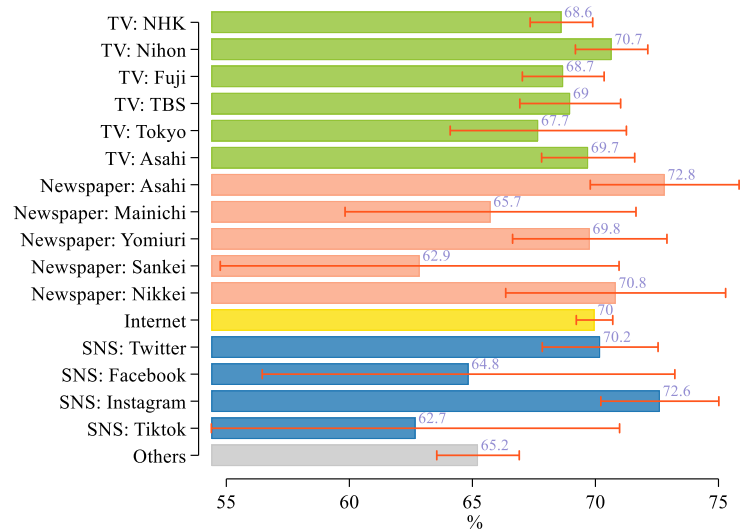

Fatality Risk

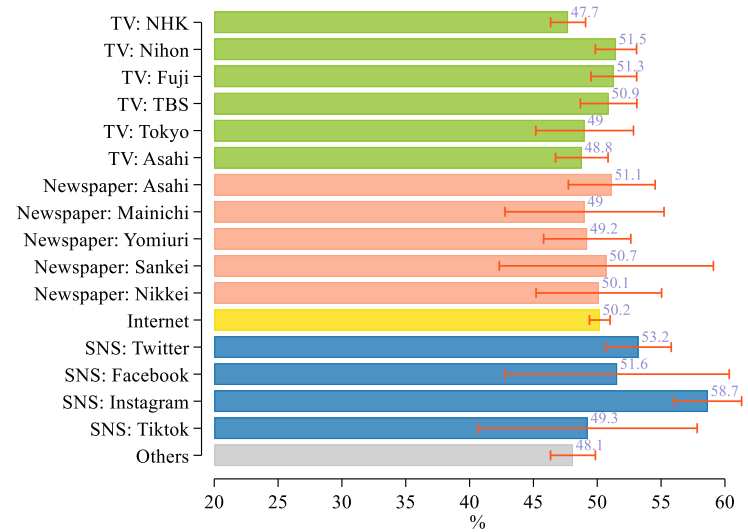

Note: N(Full Sample) = 40,000.

Information sources and infection risk perception: Overestimation

Infection Risk Over 1%

Infection Risk Over 5%

Infection Risk Over 10%

Information sources and infection risk perception: Underestimation

Infection Risk Under 0.001%

Infection Risk Under 0.01%

Infection Risk Under 0.1%

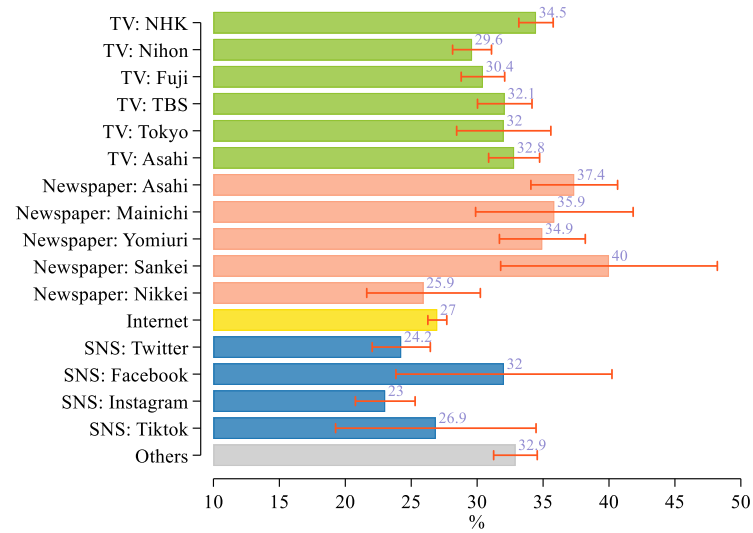

Information sources and fatality risk perception: Overestimation

Fatality Risk Over 1%

Fatality Risk Over 5%

Fatality Risk Over 10%

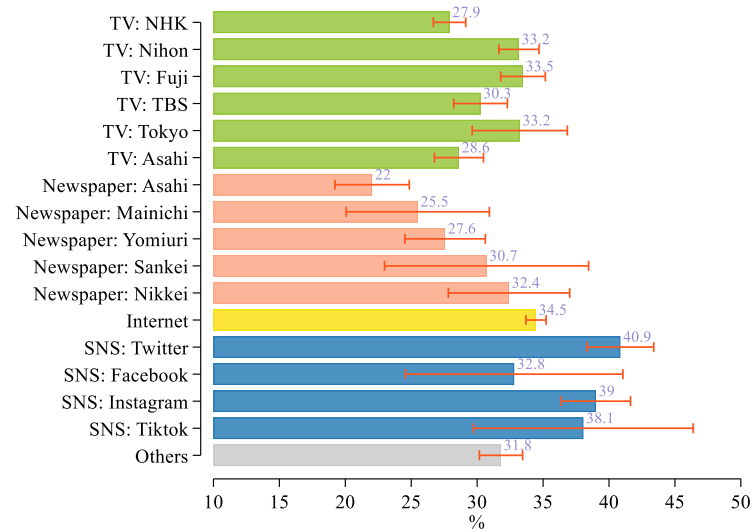

Information sources and fatality risk perception: Underestimation

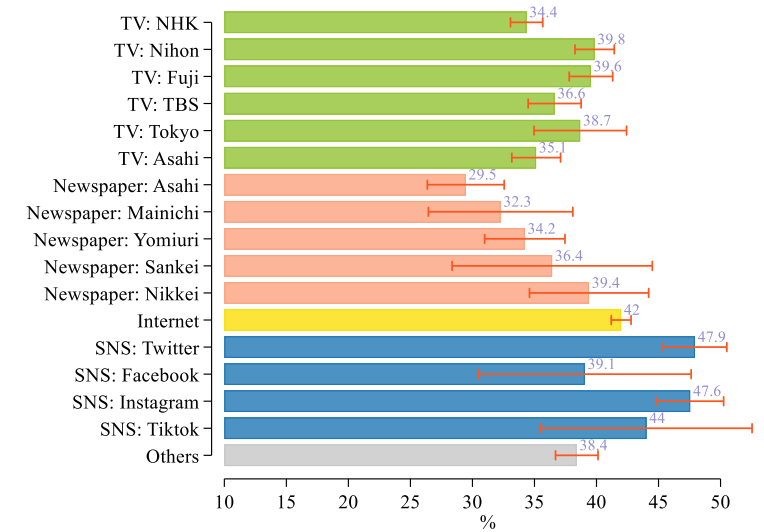

Fatality Risk Under 0.001%

Fatality Risk Under 0.01%

Fatality Risk Under 0.1%

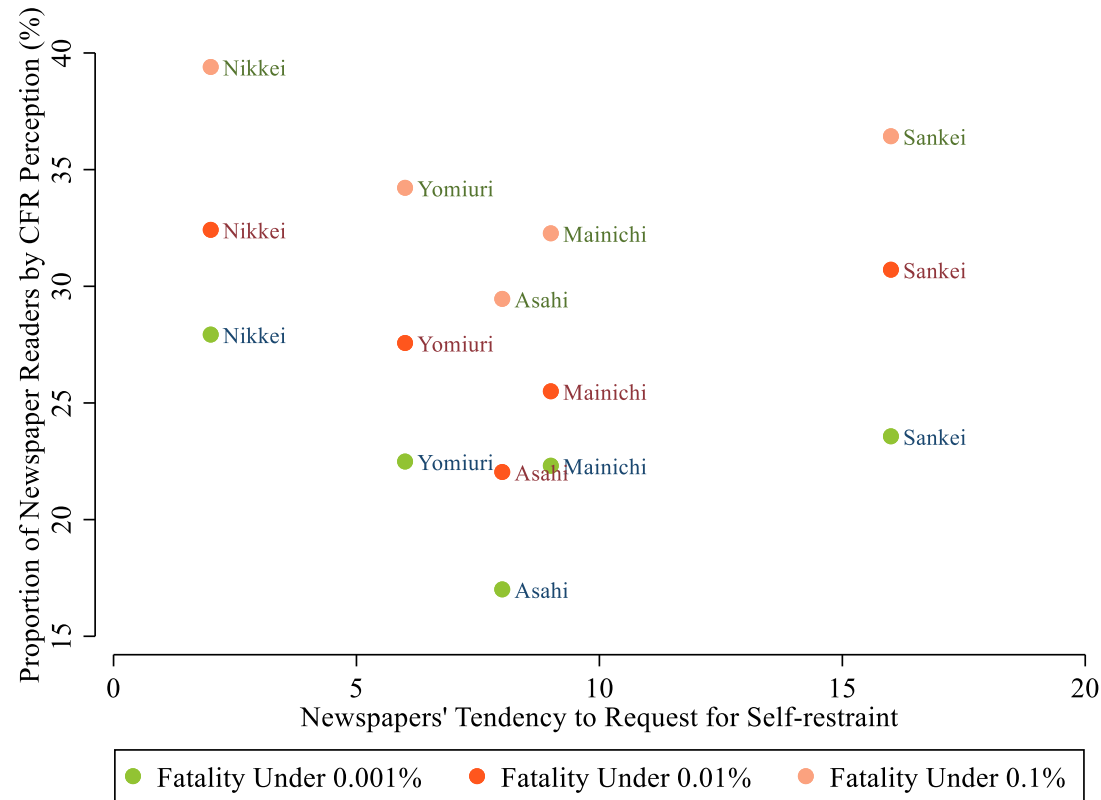

Fatality risk perception and newspapers' attitude toward COVID-19: Overestimation

Note:

- Vertical axis: Proportion of newspaper readers who perceived the CFR above 1%, 5%, or 10%.
- Horizontal axis: Newspaper's intensity to urge readers to practice self-restraint and preventive measures, computed using data on media-driven evocation published by Sugawara et al. (2021)

Fatality risk perception and newspapers' attitude toward COVID-19: Underestimation

Note:

- Vertical axis: Proportion of newspaper readers who perceived the CFR below 0.001%, 0.01%, or 0.1%.
- Horizontal axis: Newspaper's intensity to urge readers to practice self-restraint and preventive measures, computed using data on media-driven evocation published by Sugawara et al. (2021)

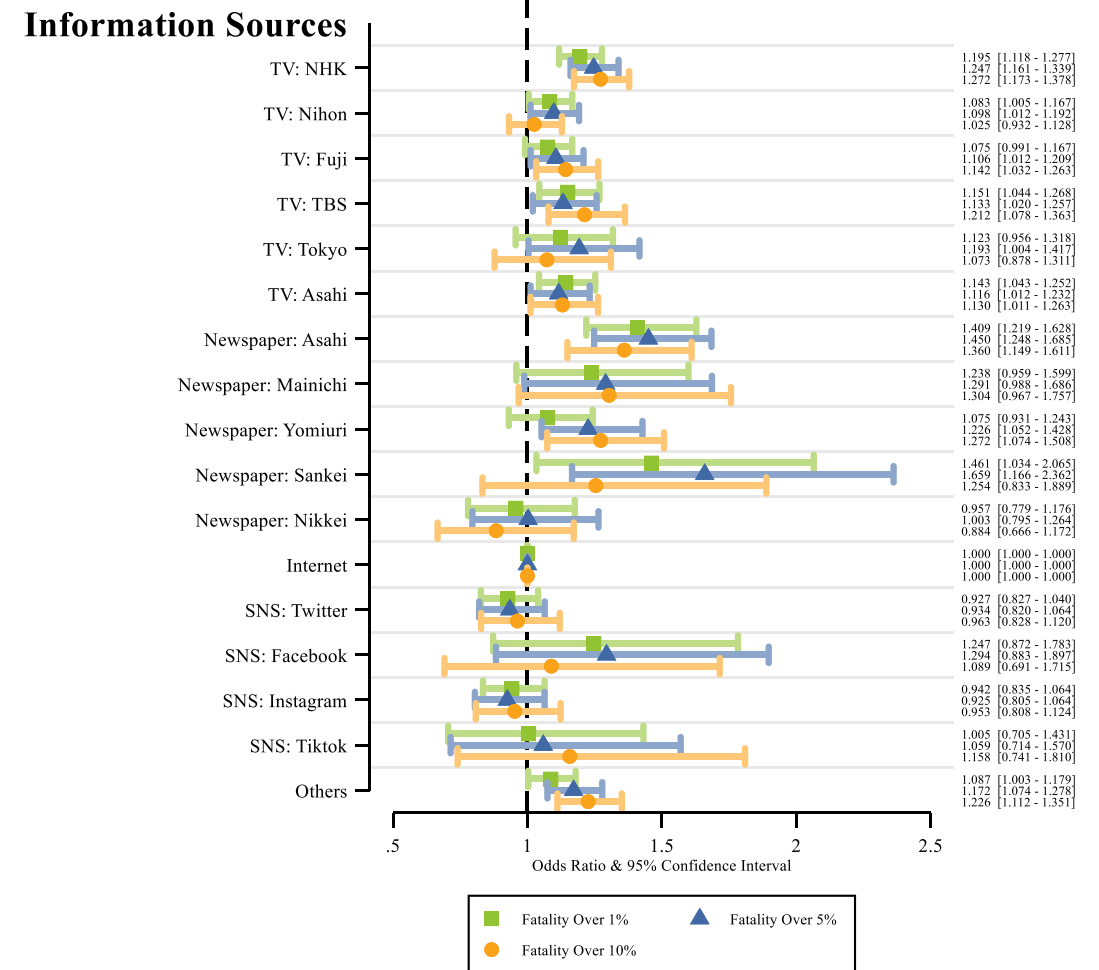

Multivariate Analysis

- Model: Logistic regression
- Outcome variables:
 - *Infection (Fatality) Over 1%, 5%, 10%*: equals 1 if the subjective risk of infection (fatality) is equal to or higher than 1%, 5% or 10%.
 - *Infection (Fatality) Under 0.001%, 0.01%, 0.1%*: equals 1 if the subjective risk of infection (fatality) is less than 0.001%, 0.01%, or 0.1%.
- Independent variables:
 - Primary media source: the source of media the respondent refers to the most
- Covariates:
 - Demographic factors (education, income, age group, gender, household structure)
 - Vaccination status, health situation
 - Proxies for COVID-19 related experiences (*Infected with COVID-19* and *Acquaintances Died of COVID-19*)
 - Prefecture fixed effects

Determinants of risk overestimation – Logistic regression

Infection Risk

Fatality Risk

Note: N = 40,000. In the regressions, we also control for individual characteristics and prefecture fixed effects.

Determinants of risk underestimation – Logistic regression

Infection Risk

Fatality Risk

Information Sources

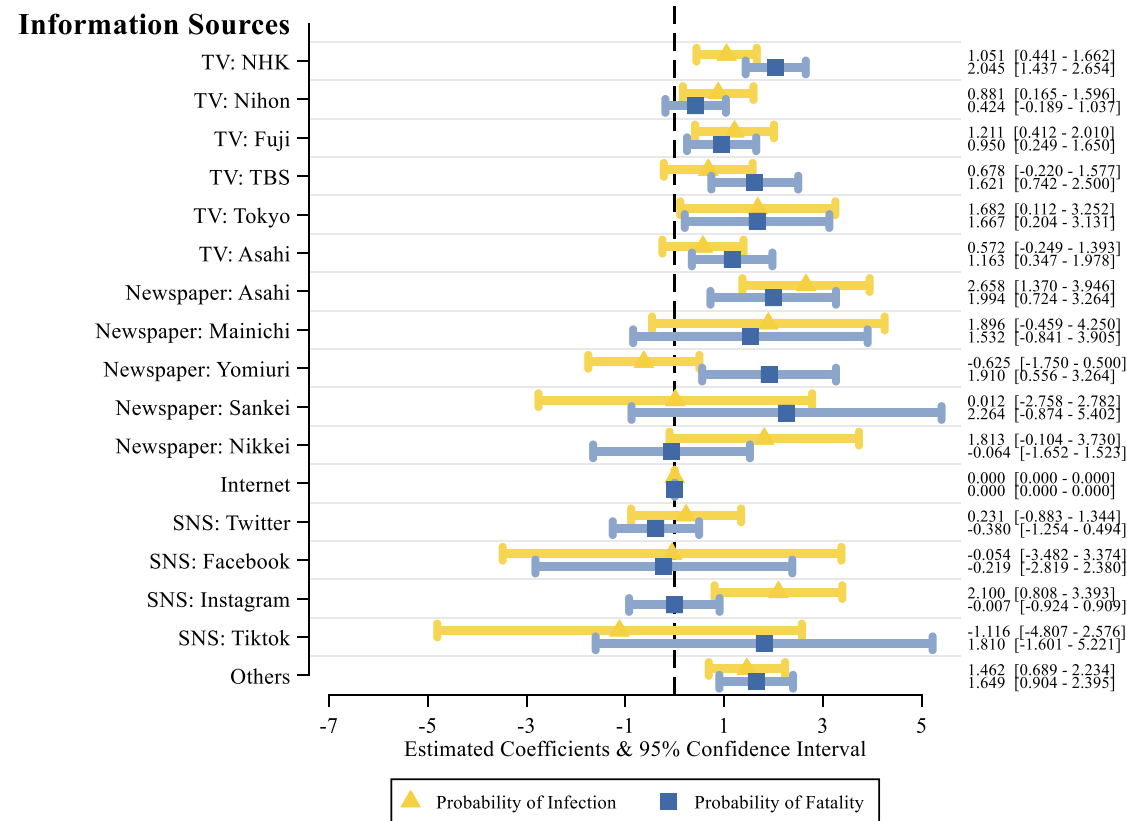

Information Sources

Note: N = 40,000. In the regressions, we also control for individual characteristics and prefecture fixed effects.

Robustness - Linear Regression

Note: The outcome variables are continuous.

- *Probability of Infection (or Fatality)*: the midpoints in responses about subjective risks.
- Example: A participant rated the infection risk to be 50% or higher → the *Probability of Infection* would be 75%.
- In the regressions, we also control for individual characteristics and prefecture fixed effects.
